- Chained time series: to avoid the problems arising when the sample of firms differs in two consecutive bases, the chart is prepared using the averages for the two years common to those two bases, except for the last two observations. Given the lesser coverage of the latest base, the 2015 observation is obtained from that of 2014 by applying the internal rate of change of the 2015 base.
- The continuous line depicts the bisector on which, ideally, the observations of each sector of activity should lie in the event of full coincidence between the two sources of statistical information (CBI and Social Security registrations). The observations showing distance from this line are thus those that evidence a greater discrepancy. Their absolute significance arises from two differences: one, between the rates of change observed in both sources; and another, owing to the differences in the weights of the sample and population.
